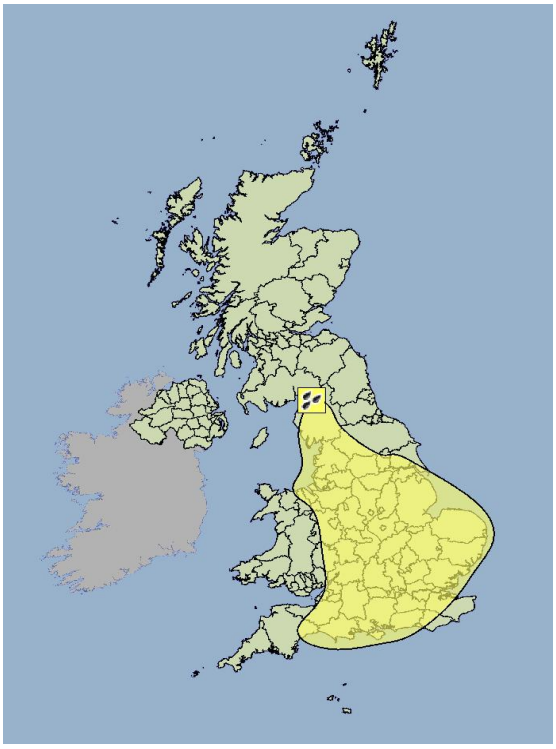
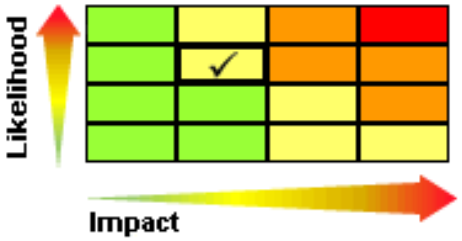
National Severe Weather Warning Service





Chief Forecasters Assessment
A complex frontal system will maintain relatively warm and humid conditions across much of the area. Where sunshine breaks through, rising temperatures will help trigger scattered heavy downpours, with local thunder, and these will be slow-moving, given the light winds. 15-25 mm of rain could fall locally within an hour, with 30-40 mm possible in the space of 3 to 4 hours. Such amounts are likely to cause localised flooding, especially if they affect urban areas, or areas affected by downpours in recent days.

The Met Office have issued a **Yellow Warning** of **Rain**

Valid from **12:00 on Sun, 12th Jun 2016** until **21:00 on Sun, 12th Jun 2016**

Although some areas, perhaps even individual counties, are likely to escape the heaviest rain, some slow-moving, heavy, thundery downpours are again likely to develop across parts of the warning area on Sunday afternoon. The showers and thunderstorms should ease from the west during the evening.

This is an update, to adjust the area (for example pulling the western boundary further west towards the Welsh border), and slightly increasing the peak hourly rainfall.

Please be aware of the risk of localised flooding and possible disruption to travel.
